

**Purpose of resurfacing a street:** To place a new layer of asphalt on the street to extend the life of the pavement by 10 years or more delaying more costly and time consuming fixes in future years.

The asphalt removal and replacement on each street will take about 2 days to complete. The first day will be to grind a portion of the asphalt pavement off the street. The second day will be to overlay the street with a new layer of asphalt. The street will be posted no parking and closed to thru traffic during the work.

No geometry changes are proposed to the streets within the project area. A small amount of concrete curb and gutter replacement will take place ahead of the city resurfacing the asphalt on the street. Private utilities may also upgrade their underground facilities prior to the city resurfacing each street to avoid damage to the new asphalt pavement.

Property owners within the projects zone of influence will be assessed.
